

## MediCare Local sample guideline

Original prototype text for the local knowledge base.

This file is not a clinical protocol and does not replace a clinician.

### Emergency warning signs

If a person reports trouble breathing, chest pain, fainting, one-sided weakness, confusion, severe bleeding, a rapidly worsening allergic reaction, or thoughts of self-harm, advise them to contact emergency services before any other step.

### Symptom history to capture

Ask when the symptom started, how it has changed, how severe it is, what makes it better or worse, and any medicines or conditions already known. Record the person's own words after they have reviewed them.

### Non-urgent supportive steps

For mild symptoms without emergency signs, rest, fluids, and noting the timeline are reasonable while the person arranges clinical care. Do not present this prototype as a diagnosis or a prescription.

### Knowledge sources

Answers should stay grounded in retrieved local PDF passages and the indexed question-answer pairs. If those sources do not cover the question, say so plainly.
